

My Experience In Creating This Website

In grade 10 at the end of semester 2, I had an important experience creating a portfolio website for my final collaboration project. This project combined several subjects, such as English, mathematics, Indonesian, and others. But it was still an individual task. I felt excited and nervous because it was a final project, even though it was not my first time creating a website.

First, I started by planning the content of my portfolio. I wrote an “About Me” section, listed my skills, and prepared some of my works to display. After that, I designed the layout using Figma to make sure the website looked neat and attractive. Next, I began coding the website using HTML, CSS, and a little bit of JavaScript. At first, I faced some difficulties, especially when making the layout responsive and fixing errors in my code. Sometimes, certain buttons did not work properly, so I had to check my code many times to find the mistakes.

Then, I continued improving the design by adding colors, images, and animations to make the website more interesting. I also made sure that the navigation worked well so users could easily explore the pages. I still tried my best to finish everything before the deadline.

In the end, I successfully completed my portfolio website. I felt very proud because I learned many new things, especially about web development and problem-solving. This experience was challenging, but it also made me more confident in my skills and motivated me to create better projects in the future.
